

Project Report Guideline

1. General Formatting Requirements

- The report **must not exceed five pages in total**.
- Use the page limit critically and report only the most important findings, figures, statistics.
- At most two pages long appendix to include additional **supporting** statistics, forecasts/predictions and tables/figures.
- Use Times New Roman, 12-point font throughout the document.
- Use 1.15 line spacing.
- Use justified alignment for the main text.
- Use clear section headings and consistent spacing.
- Include only figures, tables, and screenshots that directly support the analysis.
- Avoid unnecessary background information, repetition, and overly long descriptions.

2. Required Report Components

The report must include the following components:

- Problem statement and project objective.
- Explanation of the implemented approach, including the main functions and/or classes used in the code.
- Pseudocode or a clear algorithmic explanation of how the solution works.
- Important computational, analytical, or empirical findings.
- **Business recommendations or managerial insights derived from the findings.**
- A final part is dedicated to the distinct roles and specific contributions of all team members.

3. Page Allocation

The recommended (**not necessary**) page allocation is as follows:

Page 1-2: Group members, problem statement, project objective, scope, and relevance. Why is this problem in a business sense? How would you would like to handle the problem?

Page 2-3: Methodology, data or input structure, assumptions, and code architecture. Pseudocode or explanation of functions/classes and workflow logic.

Page 4-5: Main findings, interpretation, business recommendations, and managerial insights.

Page 5: Team-member roles and individual contributions.

4. Problem Statement

This section should define the decision problem or analytical problem addressed by the project. It should explain the context, motivation, affected stakeholders, and expected contribution of the project. The scope should be precise and feasible within project limits.

INCLUDE ONLY ONE OF THE ARTICLES 5 and 6!

5. Methodology and Code Explanation

This section should describe how the solution is implemented. It should identify the main inputs, outputs, assumptions, functions, classes, and workflow. The explanation should focus on logic and structure rather than copying large blocks of source code.

If classes are used, describe the purpose of each class, the main attributes, and the main methods. If functions are used, describe the role of each major function, its inputs, and its outputs.

6. Pseudocode or Algorithmic Workflow

This section should present the computational logic in a compact and readable form. The pseudocode should show the order of operations, decision points, loops, and output generation. It should be understandable without requiring the reader to inspect the full source code.

7. Findings and Managerial Insights

This section should summarize the most important results obtained from the implementation. The findings should be directly linked to the project objective and supported by relevant outputs such as performance measures, comparisons, or visual summaries.

The managerial insights should translate the results into practical implications. They should state what a decision-maker can learn from the analysis, which actions are recommended, what trade-offs exist, and what limitations should be considered before implementation.

8. Team-Member Role part

The final part must be reserved for the contribution statement. It should identify each team member and describe their primary responsibilities. The roles should be specific, transparent, and connected to the actual work performed in the project.

The contribution statement should cover activities such as problem formulation, data preparation, coding, debugging, analysis, visualization, report writing, formatting, and final review. Shared responsibilities may be stated, but each member's main contribution should remain identifiable.

1. Please explicitly write if a member did not contribute!
2. Although you can share responsibilities, each member must know **every part** of the study. We will ask questions randomly to each member.

9. Quality Checklist Before Submission

- The report is five pages or shorter.
- The last part is dedicated to team-member roles.
- All required sections are included.
- The code explanation is understandable without reading the full source code.
- The findings are linked to the project objective.
- The recommendations follow logically from the findings.
- Formatting is consistent: Times New Roman, 12 pt, 1.15 spacing, justified alignment.
- Grammar, spelling, numbering, figures, and tables have been checked.
